

Smart Power Strips:

Traditional power strips are an affordable way to expand the number of electrical outlets in your home or office but their convenience can encourage you to leave electronics plugged in all the time -- and many devices keep drawing power even when you're not using them.

Smart power strips, on the other hand, work to reduce your power usage by shutting down power to products that go into standby mode such as printers and computers. You could combat vampire power by continually unplugging your gadgets, but with a smart power strip you won't have to.

If you really want to save energy in your office, consider trying a smart power strip!
